

VERDI

Rewarding lower-impact choices

Shayaan Haq and Alexander Lu

Verdi

For people

Connected activity, personal guidance and rewards for supported reductions.

For program owners

Consent-based analytics to understand participation and emission sources.

For distribution partners

A sustainability experience designed for banks, employers and campuses.

The problem

Activity data arrives in fragments

A payment, meter reading and journey can describe overlapping parts of the same behavior.

People need a reason to keep participating

A useful action and a tangible reward can make feedback worth returning to.

Institutions need evidence they can act on

Program teams need coverage and source breakdowns, with participant control over sharing.

Initial customers and distribution

Initial users: people in a defined program

Commuting and home-energy activity provide a focused first use case.

Initial buyer hypothesis: campuses and employers

Evaluate a sustainability incentive program with consented participant analytics.

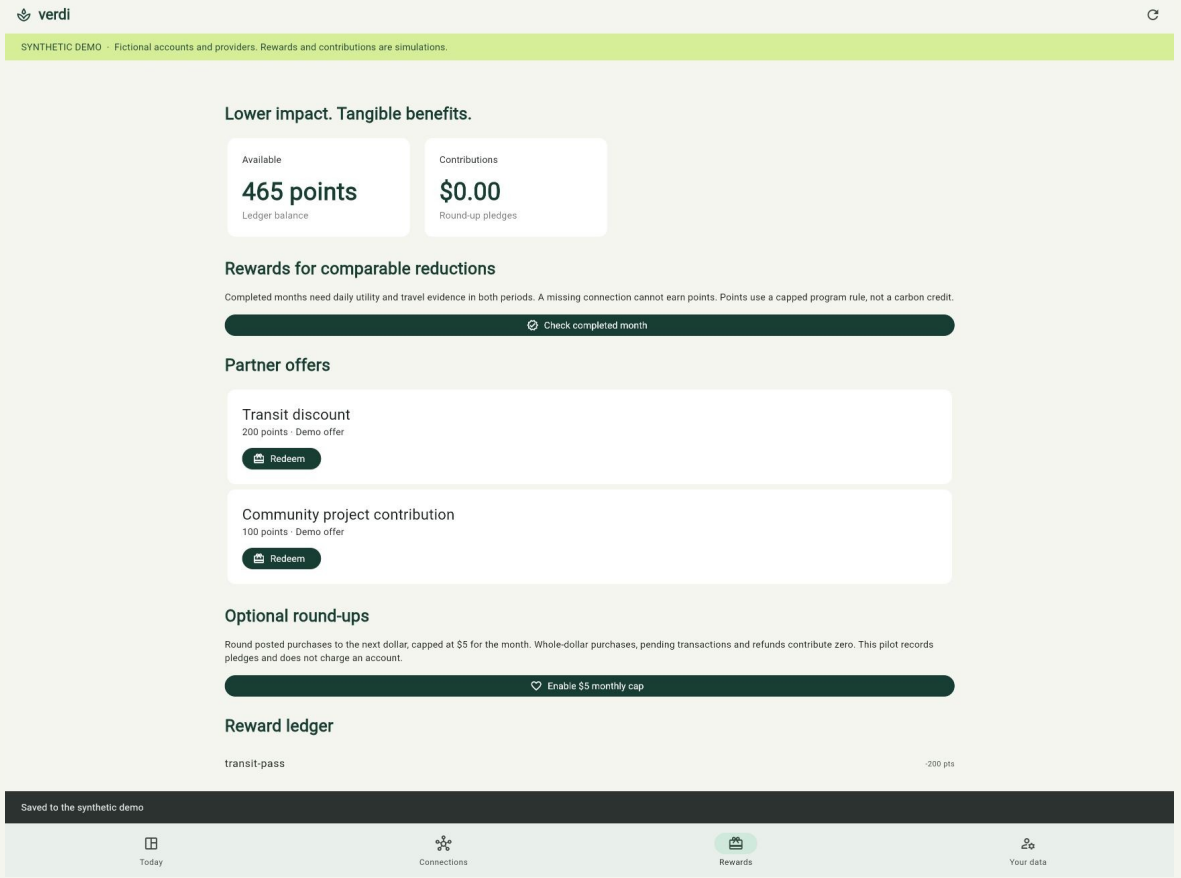

Expansion: financial institutions

Bank distribution and optional round-ups follow provider integration and pilot evidence.

The incentive experience

A reward ledger connects comparable activity coverage to a concrete program benefit.

Completed periods require comparable evidence. Missing records earn no reduction reward. Round-ups stay optional and capped.

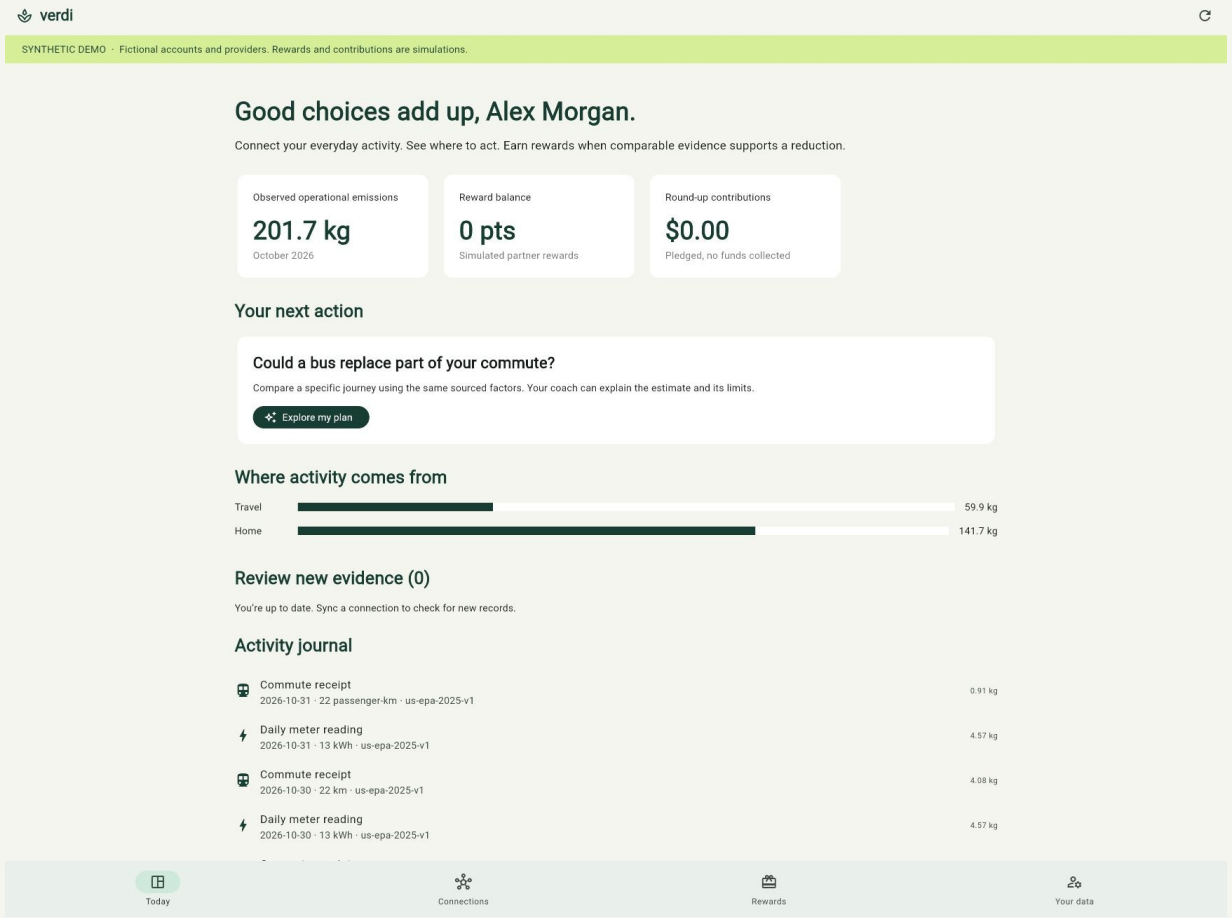

Working synthetic demo. Offers and contributions are simulated.

The consumer app

Everyday activity becomes an explainable next action

Review new evidence. Compare a specific journey. Manage connections and sharing. Track rewards in a durable ledger.

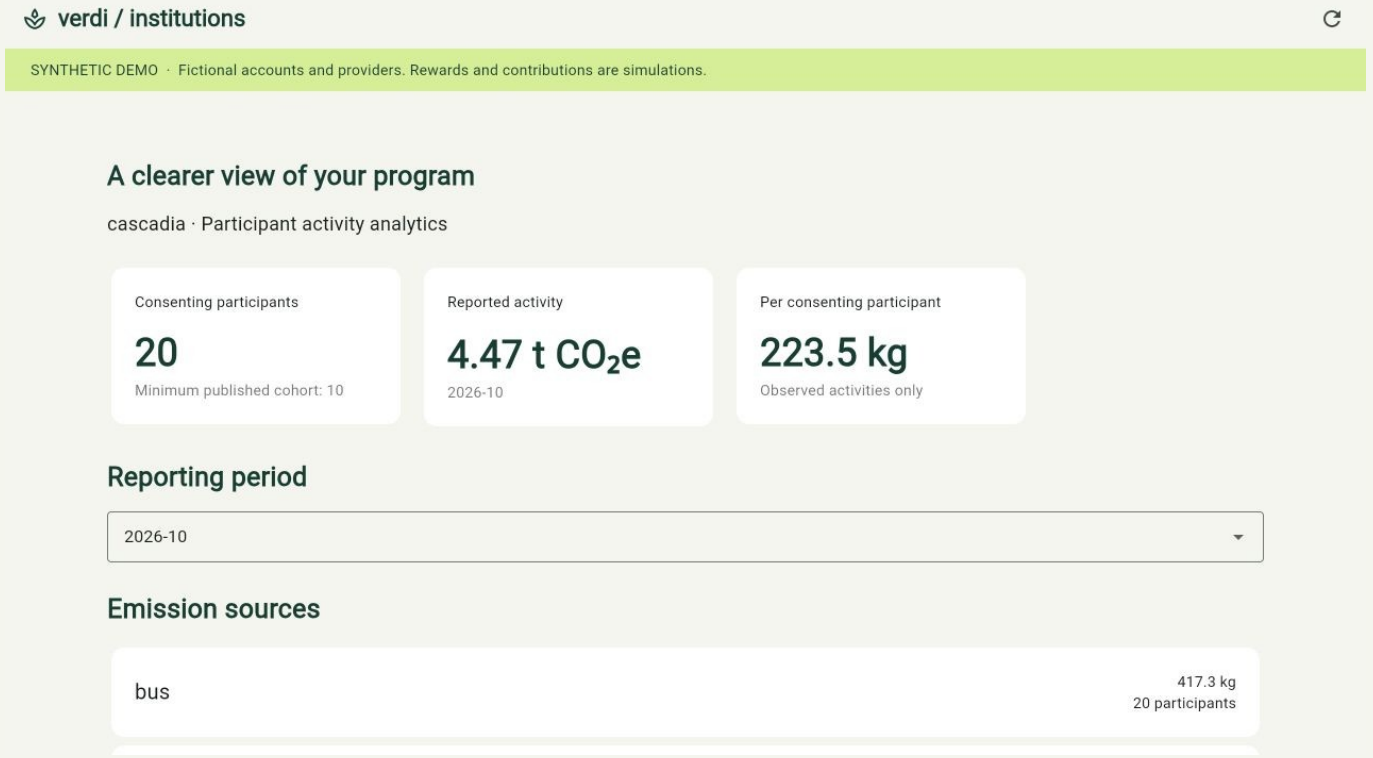

Flutter for web, Android and iOS. Synthetic demo shown.

The institution app

Reports use the same underlying activity database

Compare reporting periods and activity sources. Include only consenting participants. Suppress cohorts below 10.

Synthetic program: 20 consenting participants. No real customer data.

Revenue model

Subscriptions

Institutional program access and optional consumer premium features.

Sponsored rewards

Brands fund offers under a transparent program budget.

Consulting and reporting

Program setup, interpretation and institution-specific analysis.

Contribution and offset services

Potential service fees require payment and verified project partners.

Product readiness

Built and demonstrated

Flutter consumer and institution interfaces, SQLite persistence, review workflow, consent and reward ledger.

Implemented, awaiting live validation

Ollama coach integration with calculated guidance fallback. National operational factor coverage.

Next external dependencies

Provider authorization, payment and reward fulfillment partners, mobile field testing and a consented pilot.

Pilot metrics

Consumer usefulness

Connection activation, review completion and return usage.

Evidence quality

Coverage days, duplicate rate, source conflicts and correction rate.

Program economics

Reward cost per retained participant and willingness to pay.

Reduction evidence

Comparable period estimates, with a separate study of causal impact.

What can become defensible

A useful incentive loop built on traceable evidence

Data reconciliation and provenance

Resolve duplicate evidence while preserving calculations and their boundaries.

Partner distribution and reward economics

Build repeatable adoption through programs that benefit users and buyers.

A growing evidence base

Validate data quality and engagement with real pilots over time.

Proposed financing

$600,000

Original proposal: 20% equity, implying a $3 million post-money valuation

Fund the next evidence milestones

Provider integrations and device validation
A consented pilot with funded rewards
Pricing, retention and program economics

A product you can walk through

Consumer activity, incentives and institutional insight share one working foundation.

The next proof is a real pilot.
